All modern cars need an intuitive infotainment system – a way to control the music you’re playing, open apps, and even change settings on the car. A recent survey revealed that mapping services and a smartphone connection are more important to new car buyers than brand or engine size, so it’s an area that carmakers are clearly putting a lot of work into. I’ve tried most of the systems out there, from BMW’s iDrive to Audi’s MMI and Jaguar/Land Rover’s Pivi, and, while they’ve all got their fair share of positive points – none of them are perfect, leaving a gap for tech giants Apple and Google, with their years of experience in software and UI development, to enter the fray. The result, CarPlay and Android Auto, are essentially apps that mirror your smartphone screen on your car’s display. They’re better than the systems developed by carmakers, but still not perfect as they don’t offer total integration.(Image credit: Volvo)Enter Android Automotive, an in-car operating system that has been developed by Google. It not only includes Google Maps, Google Assistant voice commands, and YouTube Music, but also controls most in-car settings, such as the air conditioning, lighting, seats, and ride settings. Best of all, unlike Android Auto, you don’t need a smartphone plugged in (or even present in the car). You even get a built-in version of the Google Play Store, which lets you download apps directly to your car like the world’s biggest Android smartphone!Android Automotive is currently available in the Polestar 2 and Volvo XC40 Recharge (which is the car we’ve been reviewing). It’s an incredibly slick system, which can be controlled through the stylish built-in touchscreen or by saying the ‘Okay Google’ command, which works just like it does on a smartphone. It’s so well designed I never want to use anything else.The system supports multiple accounts, and switching between users will change things like the seat and mirror position. Google will provide monthly security updates and the entire system is skinnable, so car manufacturers can completely customise the design to suit the vehicle.(Image credit: Volvo)Okay, there are some downsides to Android Automotive, the main one being there are currently only a few apps available for the system. Outside of Google’s own apps and a small selection of internet radio apps, there is very little to choose from. There is no YouTube or Netflix (to entertain you during a lengthy charge) and no internet browser. We expect this to change pretty quickly. For a start, Polestar has already developed a video streaming app that includes news services and national TV broadcasts in Sweden.Can’t wait to get your hands-on Android Automotive? Although the software is currently only available on two premium, highly desirable cars, a number of other companies have signed up, from Ford and GM to Fiat and Nissan, so we think you’ll be seeing a lot more Android Automotive very soon.Liked this?Best dash cam: top car dash cams tried and testedJoin our newsletter All the best features, news, tips and great deals to help you live a better life through technology Thank you for signing up to T3. The idea of a Google TV has been broached ever since Google launched its operating system. Well it’s arrived, of sorts, as the OS of choice for Philips TVsPhilips has unveiled the first official image of Google Android (opens in new tab) running on a TV. The company announced this week at CES (opens in new tab) that it had chosen Android to be the operating system for its flagship Ambilight range of Smart TVs this year.The decision to move over to Google’s operating system is one that comes with a few benefits, for starters Philips’s new Smart TVs will have access to the entire Google Play store (opens in new tab) which means that they can download any compatible app.On top of that users will be able to then download any of the Philips Smart TV apps that are currently available on Ambilight TVs giving the new range added functionality.Gaming is also a clear focus as the new range of Ambilight TVs will come sporting ‘powerful quad-core’ processors making the new range serious contenders against the likes of OUYA (opens in new tab) and Mad Catz’s new M.O.J.O. console.Philips has also confirmed that the move will enable better integration between mobile devices and their TVs with iOS (opens in new tab) and Android devices both being targeted.As yet Philips hasn’t revealed any specific models but it has revealed that the first Ambilight TVs running Android will be available as soon as March or April 2014. When it comes to the software that runs on mobile phones and tablets, two names stand out above the rest: Android and iOS, the most prominent mobile operating systems currently available. iOS is developed by Apple and only runs on specific Apple hardware, like the iPhone and iPad. Android, on the other hand, is developed by Google and can be found on a very wide variety of devices from different manufacturers. Due to the fact that Google makes the code for much of Android freely available, anyone from hobbyists to large corporations can build on top of the Android platform. While both of these pieces of software are hugely popular, well designed, usable and adored by their respective fans, they are not the only mobile operating systems out there. Here are a few lesser-known mobile platforms that might be worth a deeper look. Ubuntu for Android In the desktop computing world, Canonical’s Ubuntu Linux has gained significant traction as a free alternative to OSX and Windows, and they are now poised to break into the phone market with Ubuntu for Android. ↪ Scroll down to continue reading article ↪ ↪ Scroll down to continue reading article ↪ Ubuntu for Android utilizes Android’s kernel (a core component of the OS) and its drivers, but promises to unleash the true power of multicore devices by accessing the hardware more directly than Android does. Canonical, the commercial entity behind Ubuntu, wants to bridge the gap between your phone and your laptop by bringing a full range of desktop applications to the mobile market, with a focus on true multitasking. Ultimately, they want their users to plug their phones into docks, which provides a laptop-like experience, allowing seamless transitions between work, play and on-the-go use of your handheld device. Phones running Ubuntu’s mobile OS should be released sometime this year, so keep on the lookout. Firefox OS Mozilla, makers of the popular Firefox web browser, are also throwing their hat in the ring and developing an operating system for the mobile market. Firefox OS is Linux-based, like Android, but seeks to differentiate itself by focusing more on utilizing open standards and community supported software as opposed to closed source, proprietary tools. ↪ Scroll down to continue reading article ↪ ↪ Scroll down to continue reading article ↪ Firefox OS offers what they are calling a truly adaptive phone experience. This means that your device will anticipate your needs and instantly deliver the information that you want from a variety of sources, including useful local content. Firefox OS is currently only available on a handful of devices, but you can expect to see that expand in the near future. Sailfish OS Developed by Finnish startup Jolla, Sailfish OS is a Linux-based mobile operating system that utilizes Mer, the successor to Nokia’s short-lived MeeGo operating system. The user interface is gesture based, with the a focus on multitasking. ↪ Scroll down to continue reading article ↪ ↪ Scroll down to continue reading article ↪ One distinct advantage that Sailfish OS boasts over the competition is a huge catalog of apps and software, as it is compatible with software made for Android, Linux, Mer/MeeGo and anything written in HTML5. Phones featuring Sailfish OS are currently available in the EU, Switzerland and Norway, at Jolla.com MIUI MIUI (pronounced “Me-You-I”) is a heavily modified version of the Android OS, made and maintained by Xiaomi Tech, a Chinese electronics company. MIUI offers a higher level of customization than stock Android, allowing users to apply custom themes, lock screens, fonts and more. ↪ Scroll down to continue reading article ↪ ↪ Scroll down to continue reading article ↪ MIUI has built-in network monitoring, spam and virus protection, a data backup app and other useful and unique features. The UI is somewhat similar to that of the iPhone, with its glossy icons and smooth screen transitions. To get MIUI, you must install it yourself on a compatible Android device, after first rooting and unlocking your phone. The process to accomplish this varies greatly by device and may very well void your warranty, so do your homework. For a list of compatible devices, head on over to MIUI’s website. Tizen is an operating system based on the Linux kernel, and is designed specifically for embedded devices including smartphones, tablets, TVs, laptops and cameras. It aims to offer a consistent user experience across a wide range of devices. Tizen is developed by the Linux Foundation, which is governed by such tech industry giants as Samsung, Intel and others. While the development of Tizen has been plagued by setbacks and delays, having been declared dead several times over the years, it was just announced last month that the upcoming Samsung Z will ship with Tizen instead of Android. The Z will be released in Russia in the third quarter of this year, with plans to bring it to further markets shortly thereafter. ↪ Scroll down to continue reading article ↪ ↪ Scroll down to continue reading article ↪ This is certainly an exciting time in the smartphone world, as competition from new mobile OS makers leads to innovation and, ultimately, an even richer phone experience for end users. What new features you would like to see on your mobile device? Let us know in the comments. Featured photo credit: Alfredo Cáceres / Phone Users via flickr
